Caution:

This information is based upon technical data that DuPont believes to be reliable. It is subject to revision as additional knowledge and experience are gained. DuPont makes no guarantee of results and assumes no obligation or liability in connection with this information.

It is the user's responsibility to determine the level of toxicity and the proper personal protective equipment needed. The information set forth herein reflects laboratory performance of fabrics, not complete garments, under controlled conditions. It is intended for informational use by persons having technical skill for evaluation under their specific end-use conditions at their own discretion and risk.

Anyone intending to use this information should first verify that the garment selected is suitable for the intended use. In many cases,

seams and closures have shorter breakthrough times and higher permeation rates than the fabric. Please contact the garment manufacturer for specific data. If fabric becomes torn, abraded or punctured, end user should discontinue use of garment to avoid potential exposure to chemical.

SINCE CONDITIONS OF USE ARE OUTSIDE OUR CONTROL, WE MAKE NO WARRANTIES, EXPRESS OR IMPLIED, INCLUDING WITHOUT LIMITATION, NO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE AND ASSUME NO LIABILITY IN CONNECTION WITH ANY USE OF THIS INFORMATION.

This information is not intended as a license to operate under or a recommendation to infringe any patent or technical information of DuPont or others covering any material or its use.

Warning: • Tychem® fabrics should not be used around heat, flames, sparks, or potentially explosive environments.
• Tychem® fabrics should have slip resistant or antislip materials on the outer surface of boots, shoe covers or other garment surfaces where slipping could occur.

StaSafe® is a registered trademark of Standard Safety Equipment Company.

Permeation Guide for DuPont™ Tychem® Protective Fabrics

Effective January 2003. This guide replaces all previously published until superseded.

How to Use this Permeation Guide

To Find Permeation Test Results

1. Locate the desired chemical in the **Chemical Index**.

The **Chemical Index** is presented in two ways:

- **Alphabetical** Index
- Index by **Chemical Abstract System (CAS) Number**

For each chemical, the following information is listed.

- Chemical name
- Chemical subclass number(s)
- CAS number
- Chemical name used in data table if name listed is a synonym
- Whether the chemical has been tested (T) or not tested (nt) on Tychem® Limited-Use and/or Tychem® Reusable Fabrics

2. Locate the subclass(es) of the chemical in the permeation data table(s). There are two separate data tables, one for limited use fabrics, and one for reusable fabrics.
3. If the chemical has been tested, find the chemical name under its sub-class(es) and read across to find the permeation test results for the chemical.
4. If the chemical has not been tested, the subclass number is provided so users may view permeation data for tested chemicals in the same subclass.

Independent Testing

All permeation tests are conducted for DuPont by independent accredited testing laboratories. Except for the chemical warfare agents, all results are based on ASTM F739, "Test Method for Resistance of Protective Clothing Materials to Permeation by Liquids or Gases under Continuous Contact. Chemical warfare agents are tested using MIL-STD282.

All tests were conducted at room temperature unless otherwise noted. Copies of individual reports are available by calling 1-800-931-3456.

What is Permeation?

Permeation is a difficult concept to grasp because it can't be seen and does not require a hole in the barrier. It occurs when a chemical is absorbed until it saturates the barrier and then desorbs, or diffuses, from the opposite surface.

You may have experienced permeation firsthand if you stepped in gasoline at a filling station. If you noticed the odor of gasoline in your car as you drove away you experienced two of the three steps involved in permeation - absorption and desorption. The soles of your shoes absorbed some gasoline, then you smelled it as it desorbed from the bottom surface of your shoe. If you had stood in the gasoline long enough, the sole of your shoe would have become saturated with gasoline and the vapors would have started to desorb inside your shoe.

When it comes to hazardous liquids, vapors or gases, permeation testing is required.

Tyvek® and Tychem® are registered trademarks of E. I. du Pont de Nemours and Company.

How Permeation Tests Are Conducted

Permeation tests are conducted following the ASTM F739 "Test Method for Resistance of Protective Clothing Materials to Permeation by Liquids and Gases." A swatch of test fabric is inserted into a special test cell, with the outside surface of the fabric toward the

challenge chamber, thus exposing it to a challenge chemical. The inside surface of the fabric is toward the sampling chamber. If the chemical moves through the protective clothing fabric and is detected on the inside surface of the fabric, it is said to have permeated the fabric.

Definitions of Terms for ASTM F739

Permeation rate: The rate at which the challenge chemical permeates the fabric. In these tables, the permeation rate reflects the steady state rate when chemical contact is continuous and all forces affecting permeation have reached equilibrium.

Minimum Detectable Permeation Rate (MDPR): The minimum permeation rate that can be detected during a permeation test. MDPR is a function of the sensitivity of the analytical measurement technique, the volume into which the permeant is collected, and sampling time. Minimum detectable permeation rates as low as 0.001 µg/cm²/minute are possible for many chemicals.

Actual breakthrough time: The time between initial contact of the chemical with the outside sur-

face of the fabric and the detection of permeation.

An actual breakthrough time of >480 does not mean there was no breakthrough. It means that permeation was not detected. Permeation may have occurred, but at a rate less than the minimum detectable permeation rate (MDPR).

Standardized breakthrough time: The time at which permeation rate reaches 0.1 µg/cm²/min. Standardized breakthrough times are used in this table. They are used for fabric comparison because they eliminate test sensitivity issues.

A standardized breakthrough time of >480 minutes does not mean there was not permeation; it means that the rate of permeation did not exceed 0.1 µg/cm²/min during the 8-hour test. When the permeation exceeds 0.1 µg/cm²/min in the first 10 minutes of testing, DuPont chooses to report the breakthrough time as immediate.

Results of permeation tests are variable. The results reported here are averages of three or more separate tests. Users should not be misled in assuming these breakthrough times and permeation rates are exact. This variability should be taken into account in material selection. (See ASTM F739.)

PLEASE NOTE: in Europe, standardized breakthrough times are based on a permeation rate of 1.0 µg/cm²/min. This is 10 times less sensitive than the basis used in North America.

Physical phase: The phase of the challenge chemical during the test being reported: solid-S, liquid-L, gas-G, mixture-M.

CAS: Chemical Abstract System

N/A: Not applicable

Permeation Guide for DuPont™ Tychem® Protective Fabrics. Effective January 2003.
CHEMICAL INDEX - Alphabetical Listing - Chemical Names and Synonyms

The Permeation Data Table shows test results for certain tested (**T**) chemicals in associated subclasses as defined in ASTM F1186. For chemicals not tested (**nt**), the chemical subclass number is provided so users may view test results for tested chemicals in that subclass. Prediction of chemical resistance of a material from data on other chemicals has not been successful. However, when data is unavailable, information on related chemicals within a sub-class may at least rank alternative chemical protective materials as to their probable chemical resistance.

Chemical Name	Name in Data Table (if Synonym)	CAS Number	Class	Sub-Class	Limited Use	Re-usable	Chemical Name	Name in Data Table (if Synonym)	CAS Number	Class	Sub-Class	Limited Use	Re-usable

Permeation Guide for DuPont™ Tychem® Protective Fabrics. Effective January 2003.

Chemical Index by Chemical Abstract System (CAS) Number

The Permeation Data Table shows test results for certain tested (**T**) chemicals in associated subclasses as defined in ASTM F1186. For chemicals not tested (**nt**), the chemical subclass number is provided so users may view test results for tested chemicals in that subclass. Prediction of chemical resistance of a material from data on other chemicals has not been successful. However, when data is unavailable, information on related chemicals within a sub-class may at least rank alternative chemical protective materials as to their probable chemical resistance.

CAS Number	Index Name	Class	Sub-Class	Limited Use	Re-usable	CAS Number	Index Name	Class	Sub-Class	Limited Use	Re-usable
50-00-0	Formaldehyde	120	121	T	nt	67-63-0	Isopropanol	310	312	T	nt
